

The Genetic Basis for the Propensity to Migrate in a Sequestered Population of Rainbow and Steelhead Trout

Ben Hecht
Columbia River Inter-Tribal Fish Commission
March 19, 2013

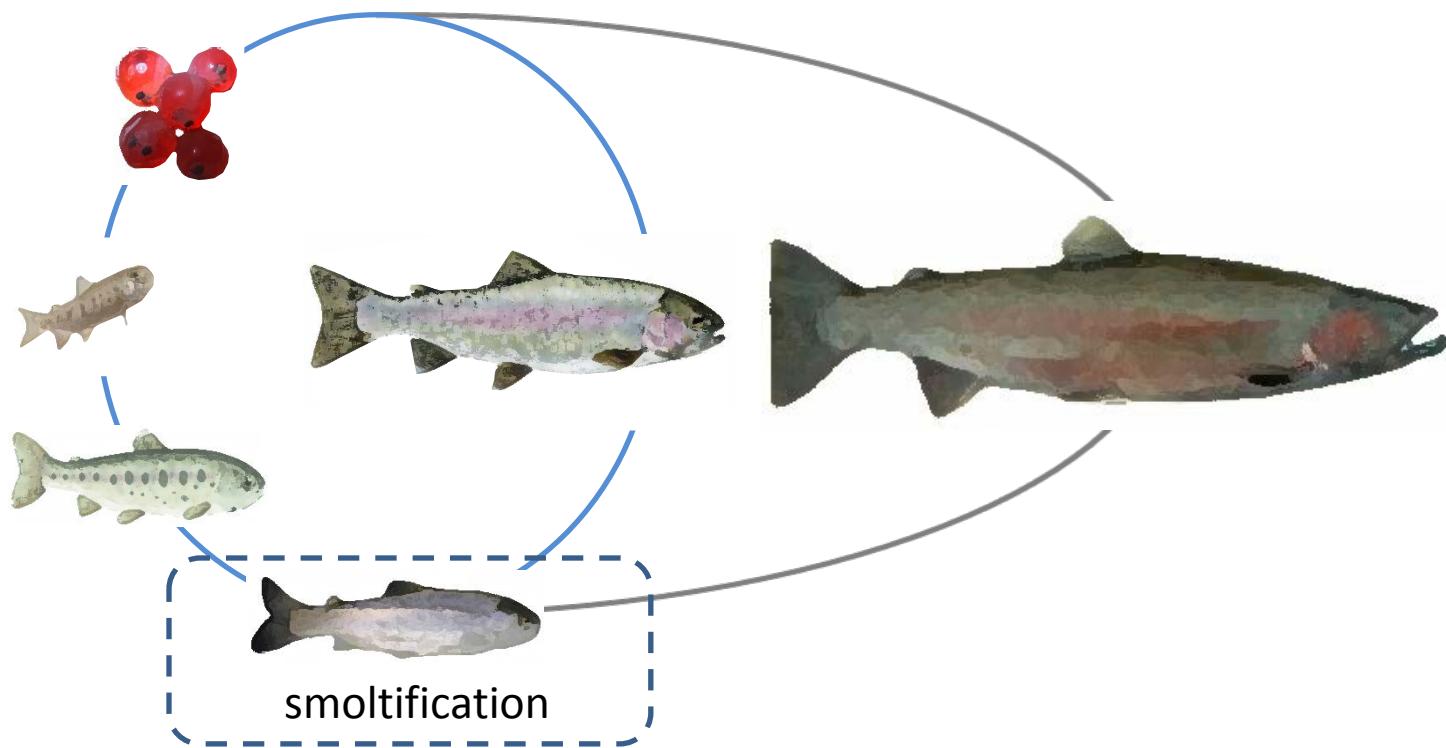

Migration

- Cultural, ecological, and economic benefits and services
- Migratory species declining globally
- Migratory species purported to have common syndrome (Dingle 2006)

Anadromy

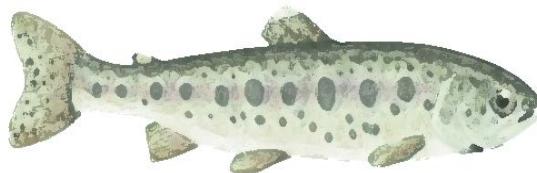

Oncorhynchus mykiss

— Freshwater

— Saltwater

Smoltification

Parr

Physiology

Environmental cues

Behavior

Morphology

Smolt

Genetic component

Objectives

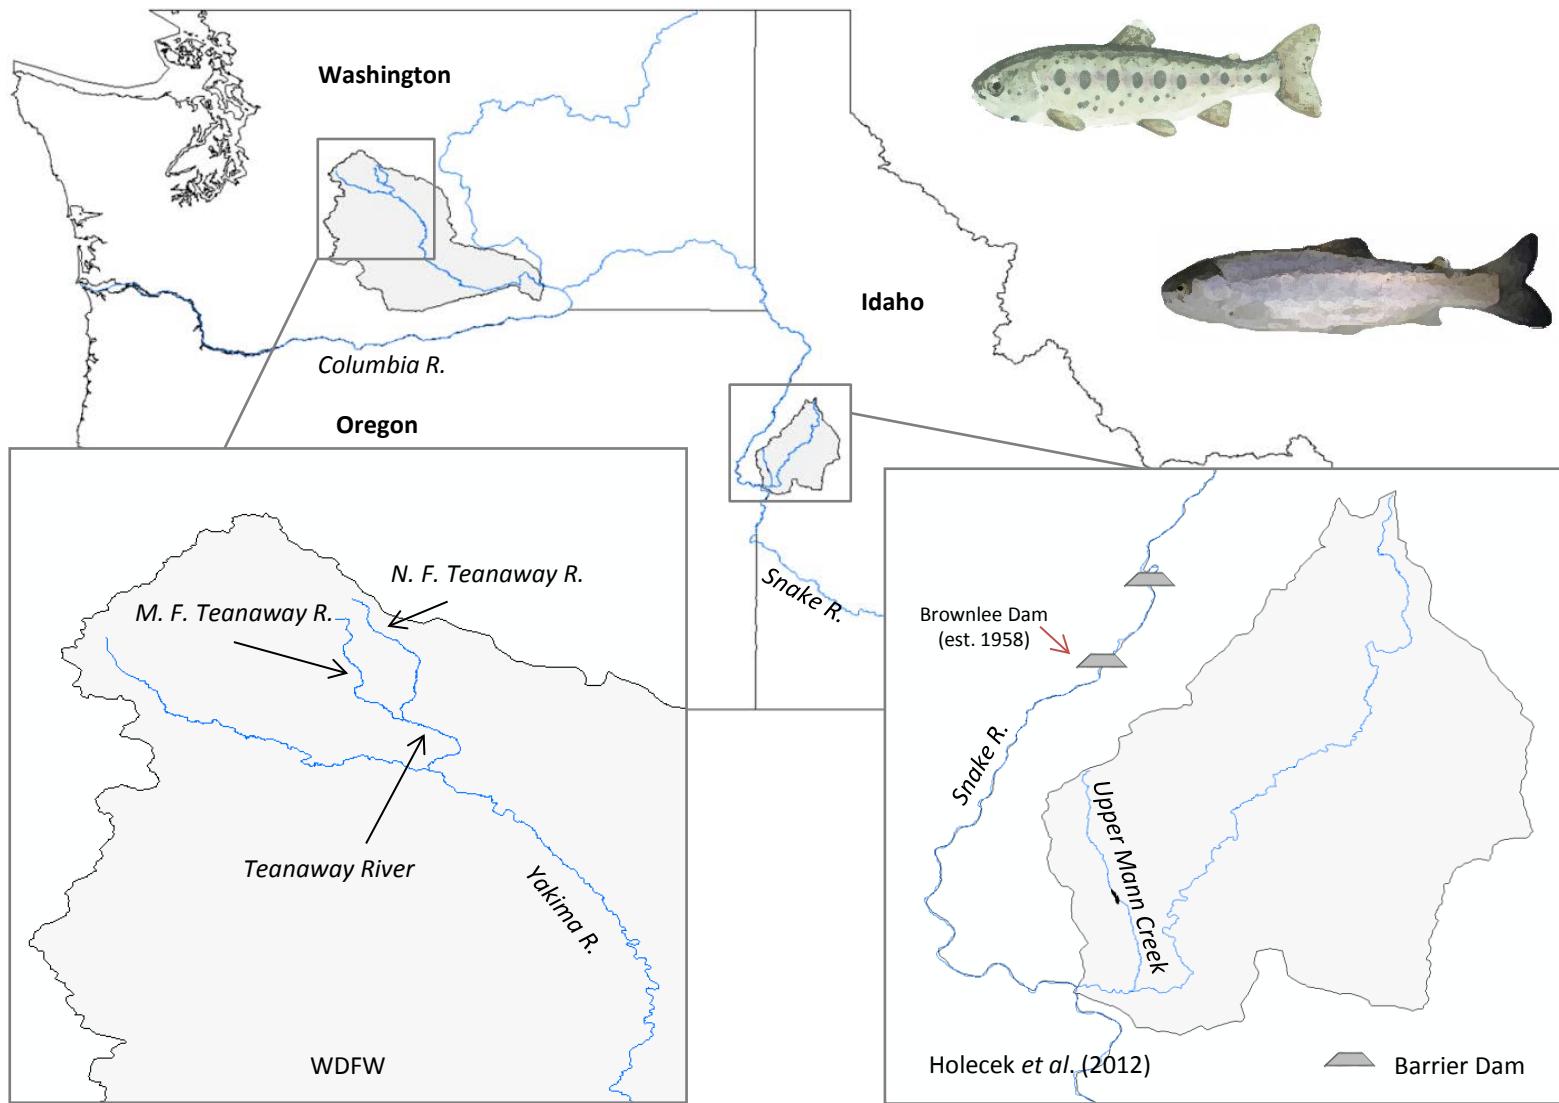

- Identify regions of the genome associated with migration
 - in a wild population of *O.mykiss* which maintains connection to ocean
 - in a wild population of *O.mykiss* sequestered for last 50 years behind barrier dam
- Are the same genetic regions associated with migration in both populations?
 - Is migration a derived trait?
 - Is migration locally adapted?

Genetics of Anadromy

Genome-Wide Association Study (GWAS)

- Samples
 - Wild populations of segregating individuals
- Genetic Markers
 - Thousands distributed throughout the genome
- Statistics
 - Marker/Trait associations

Samples

Samples

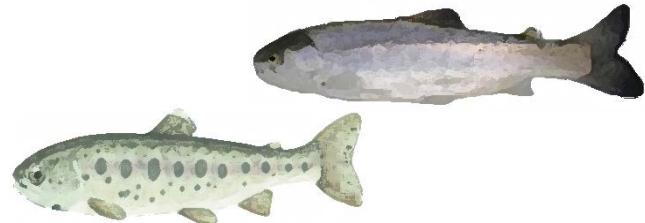

Yakima River, WA

- Electrofishing by WDFW
- PIT tagged in Spring 2008 recovered in Summer/Fall
- Resident RBT = mature w/ gametes
- Smolt = PIT array detection at downstream dam

Upper Mann Creek, ID

- Screw trap (March-June 2009)
- Parr = fish >1 yo with gametes and/or parr marks
- Smolts = silver fish >1 yo w/out parr marks

Samples

	Smolts	Residents	Total
Yakima R.	29	98	127
Upper Mann Cr.	28	27	55
Total	57	125	182

	Smolts	Residents	Total
Female	45	28	73
Male	12	97	109
Total	57	125	182

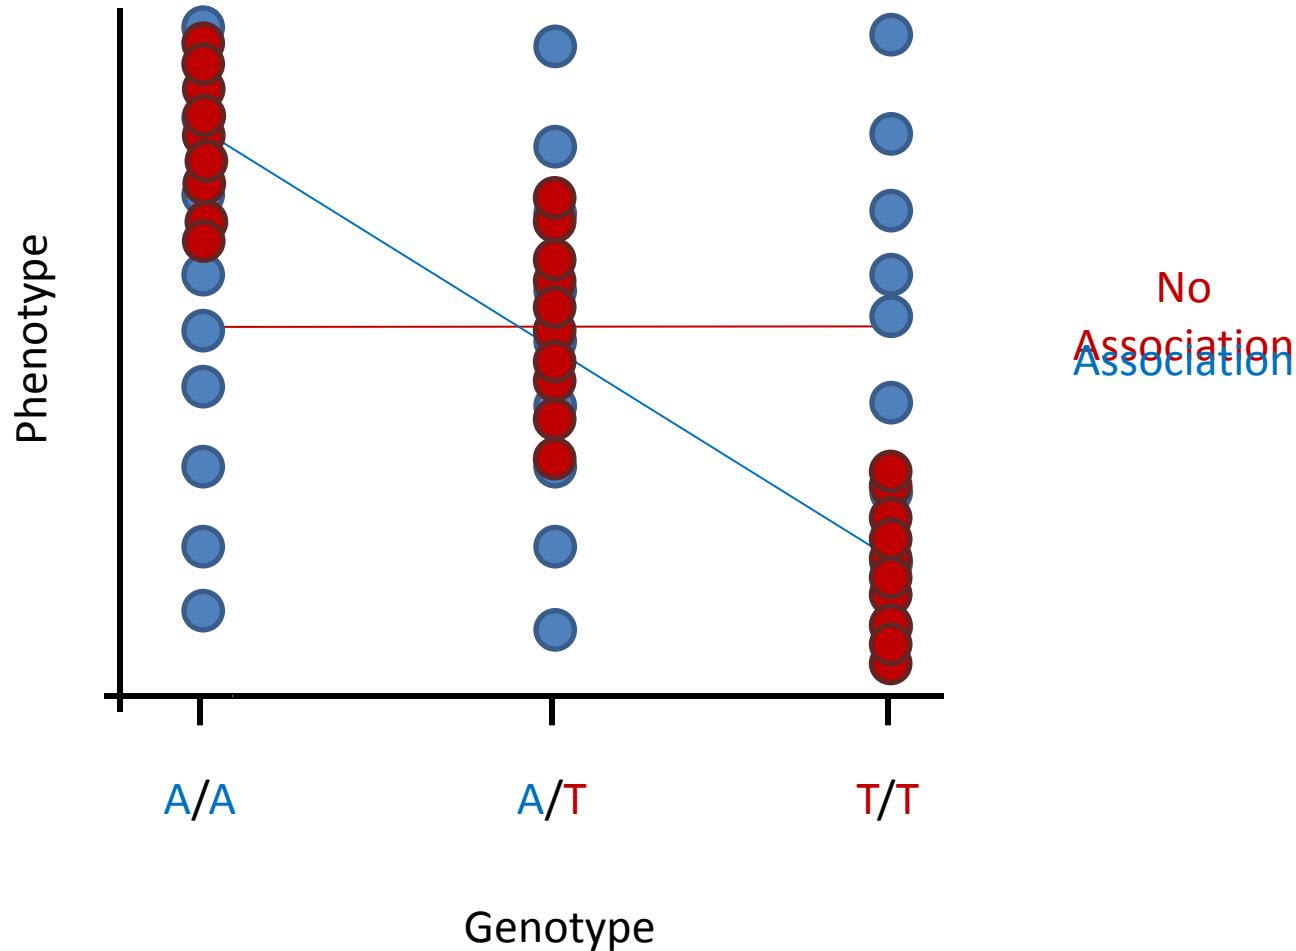

Genetic Markers

- Restriction-site Associated DNA (RAD) tag sequencing
 - Thousands of markers distributed throughout the genome
- OmyY1 – molecular sex marker

Genetic Markers

- 12,073 Polymorphic RAD-tag SNPs
- 8,219 (68%) SNPs aligned perfectly to loci from Miller *et al.* (2012) and Hecht *et al.* (2012)
- 1,148 (14%) SNPs had been assigned to a linkage group.

Statistics

Statistics

Global GWAS – Yakima River GWAS – Upper Mann Creek GWAS

GLM

$$\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{S}\boldsymbol{\alpha} + \mathbf{Q}\boldsymbol{\nu} + \mathbf{e}$$

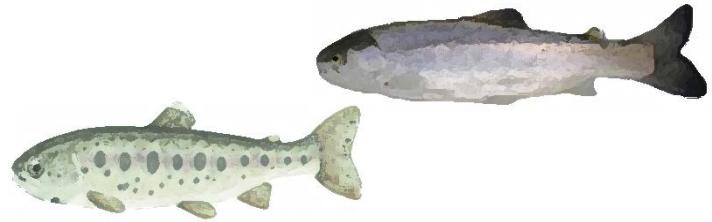

$$Life\text{-}History = SNP + sex + STRUCTURE + e$$

MLM

$$\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{S}\boldsymbol{\alpha} + \mathbf{Q}\boldsymbol{\nu} + \mathbf{Z}\mathbf{u} + \mathbf{e}$$

$$Life\text{-}History = SNP + sex + STRUCTURE + kinship + e$$

Results - GWAS

Population	# Loci	# Sig. Loci GLM	# Sig. Loci MLM
Global	5,019	58	219
Yakima River	4,338	107	50
Upper Mann Creek	6,039	22	138

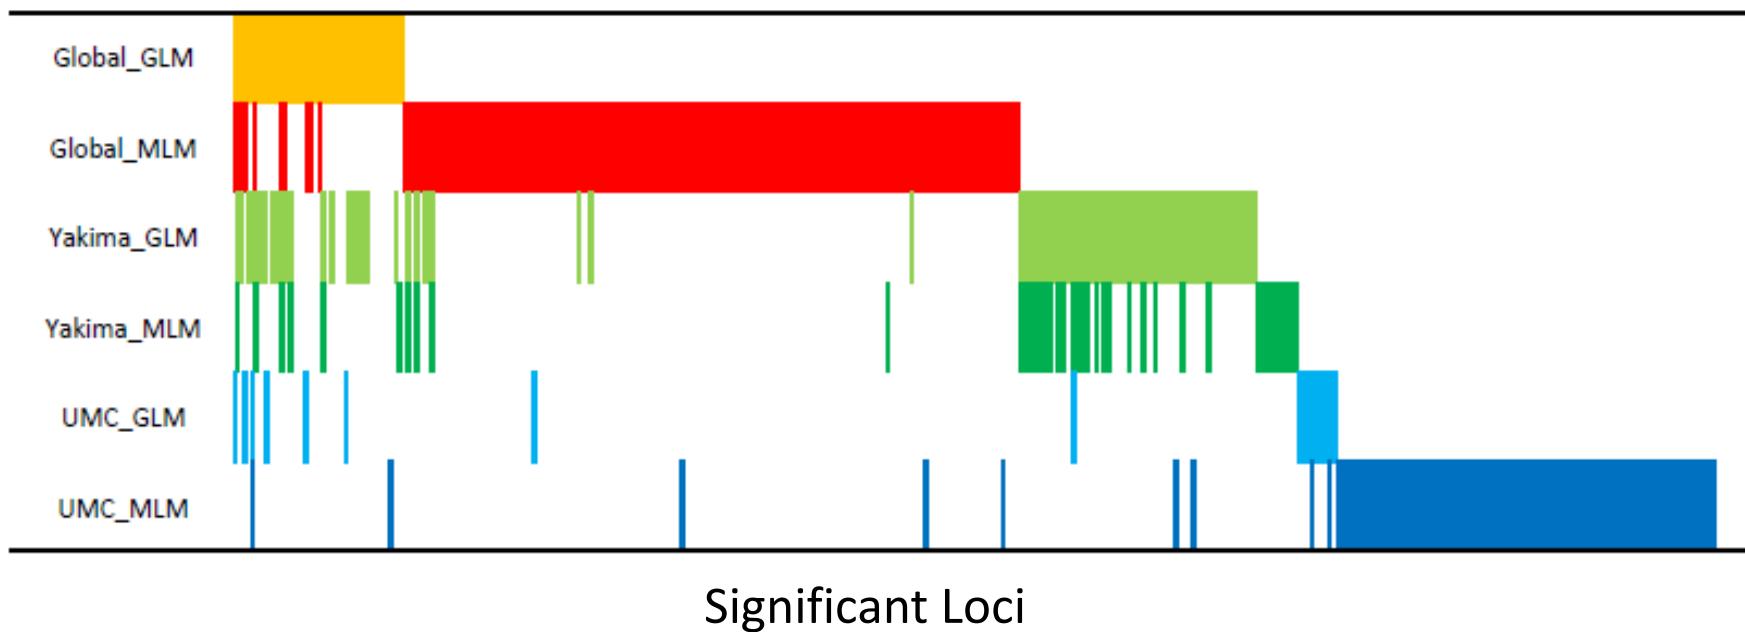

504 loci detected overall

267 loci detected in Global analyses

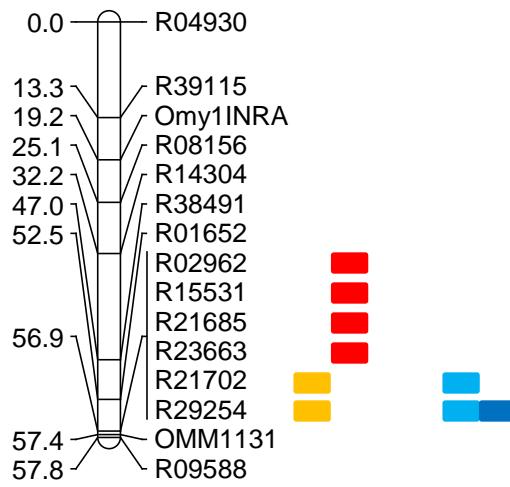

123 loci detected in Yakima River analyses

157 loci detected in Upper Mann Creek analyses

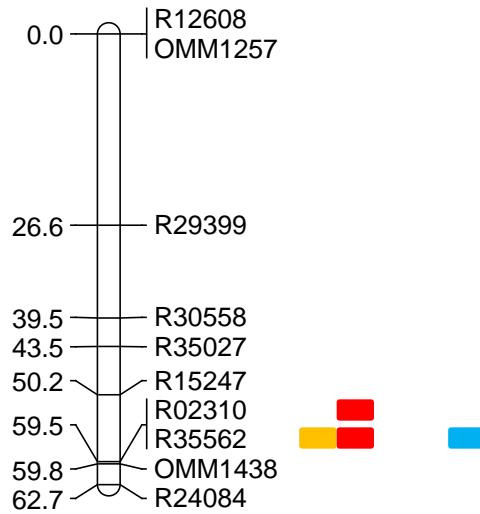

Results - Marker Overlap

Linkage map adapted from Miller *et al.* (2012)

Conclusions

- Identified 504 loci associated with the propensity to migrate in two wild populations of *O.mykiss*
- Several mapped loci localize to QTL regions previously detected suggesting some conserved mechanisms between populations
- Some loci are unique to each population, suggesting locally adapted mechanisms

Conclusions

- UMC continues to exhibit genetic variation for propensity to migrate despite 50 years sequestration above a barrier dam
- **Does this mean if passage to the ocean is restored anadromy in Upper Mann Creek would be reestablished???**

Genome-wide association reveals genetic basis for the propensity to migrate in wild populations of rainbow and steelhead trout

Results - Structure

Estimated using programs STRUCTURE and CLUMPP using a subset of 1,000 SNPs with 100% genotype frequency and MAF ≥ 0.10 . Figure generated by program DISTRUCT.

RADseq

DNA

sbfl digestion

P1 Ligation

Sonication

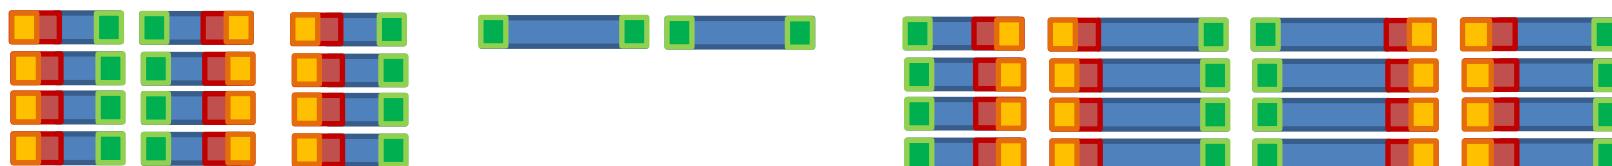

Size Select

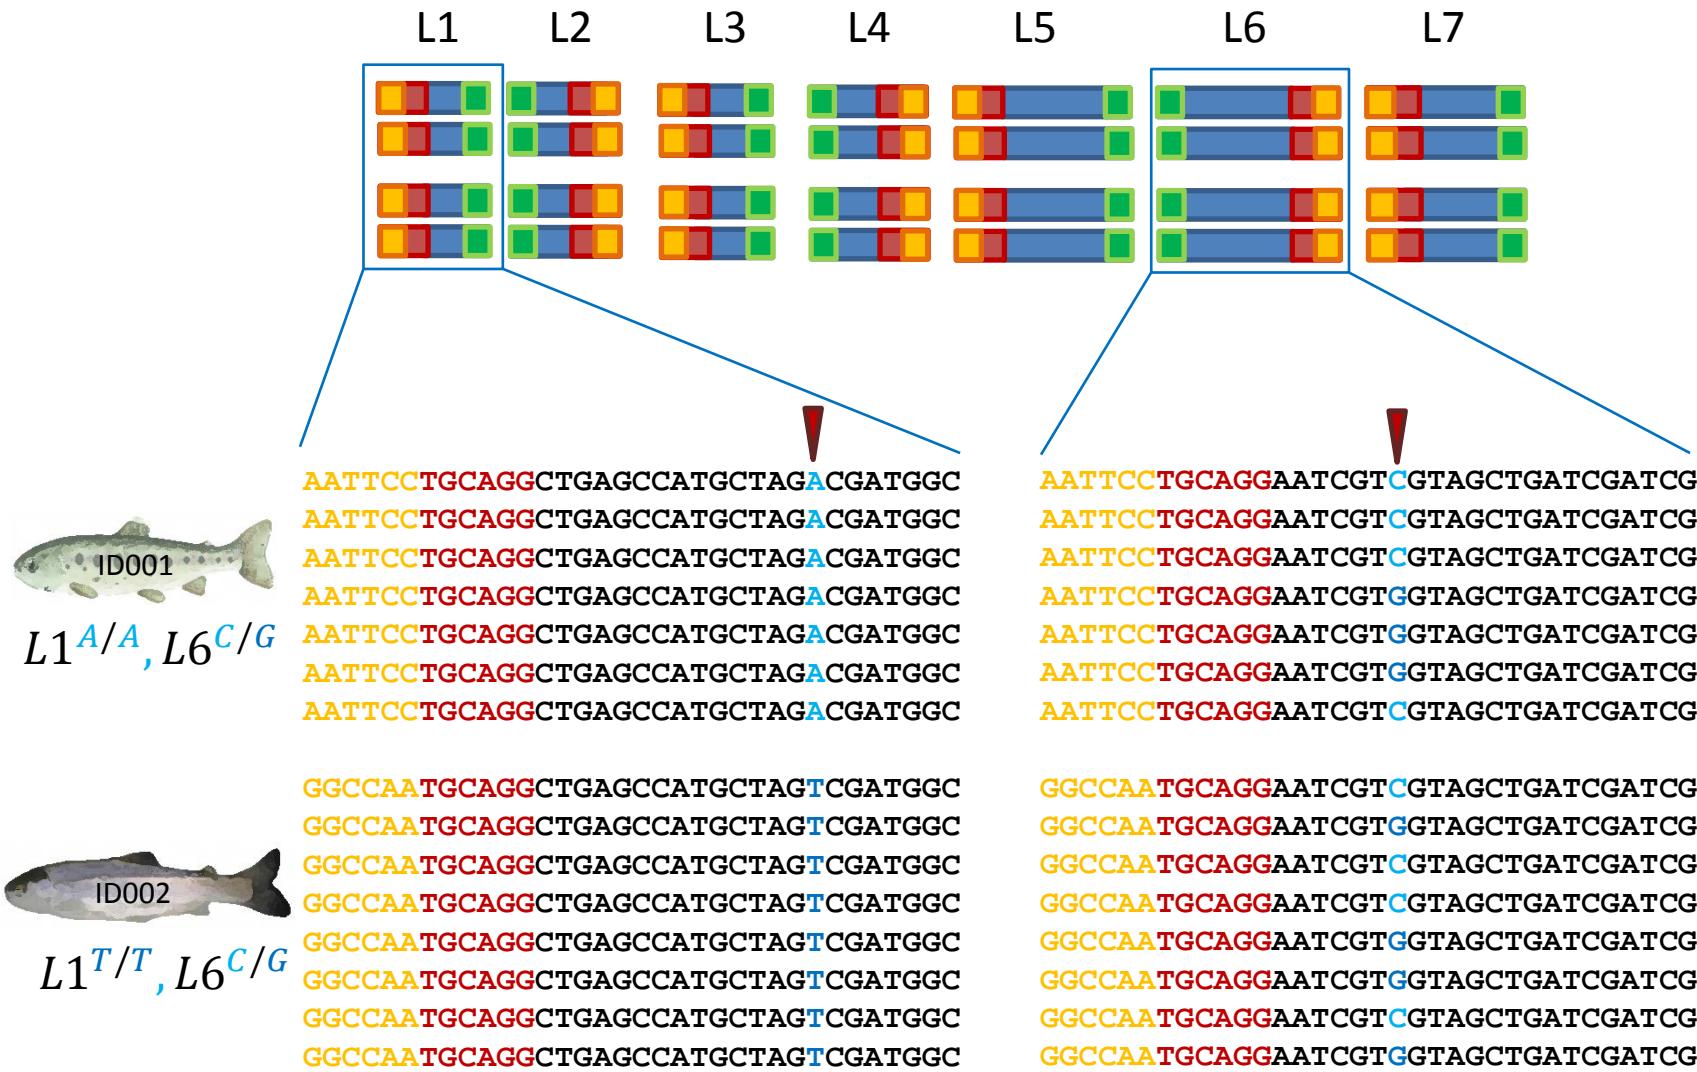

P2 Ligation

PCR

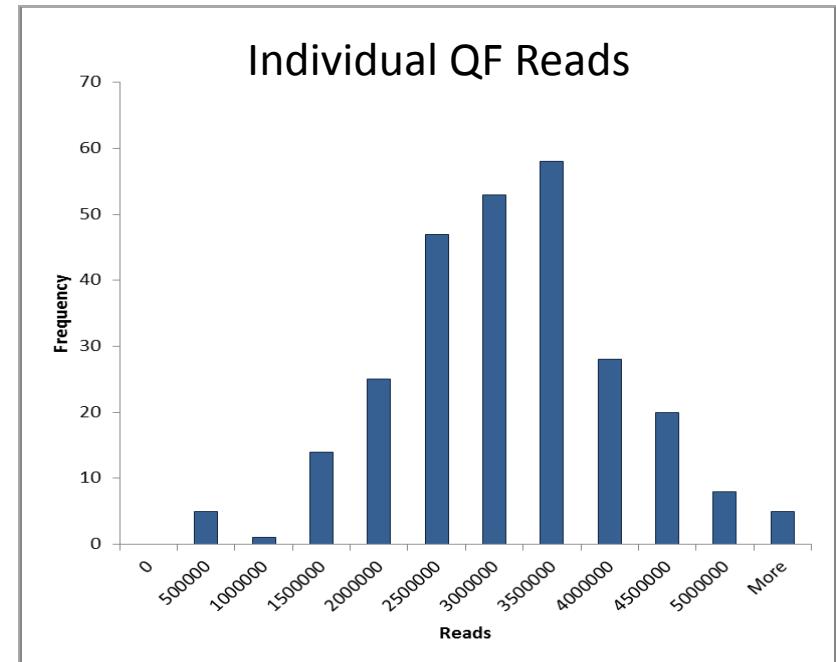

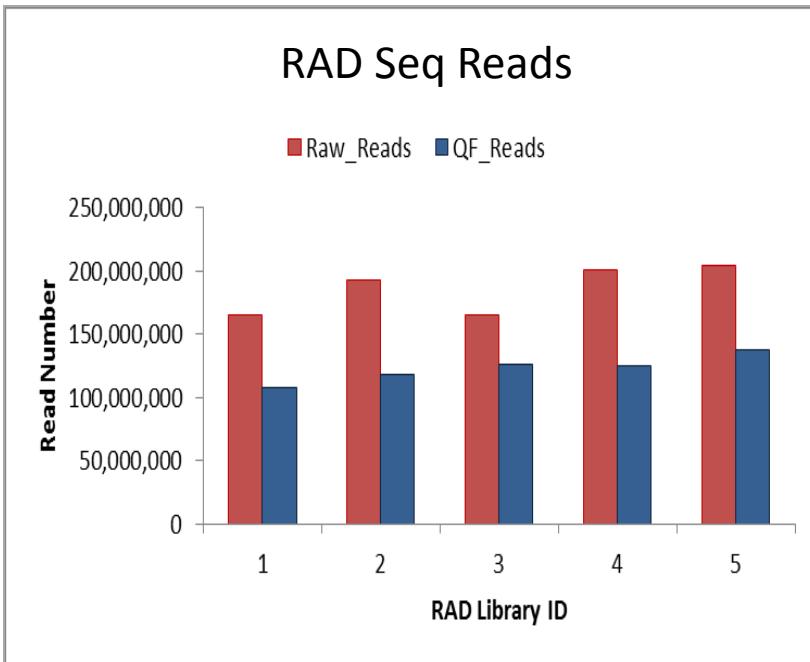

Genotyping by sequencing

Results - RAD

- 5 RAD libraries
- 38-39 barcoded samples per library
- Avg. 185M raw & 123M QF reads per library
- 189 total individuals sequenced
- Avg. 2.8M QF reads per individual
- 12,073 polymorphic loci detected
